

### Abstract of the Disclosure

5 An electronic network is monitored for abrupt or  
unexpected changes in operating parameters. Monitoring  
may include performing a first measurement of a parameter  
of the network on a first data path between a first  
electronic device and a second electronic device. A  
second measurement of the parameter may then be  
performed. An indication is provided if the difference  
10 of values of the first measurement and the second  
measurement exceeds a preselected value.
